Command Injections

Tier II - Medium - 6 hours

CREATOR 21y4d LAST UPDATED 7 Oct 2025

INTRODUCTION CONCLUSION

Command injections are among the most critical vulnerabilities in web applications, as they allow direct command execution on the hosting server, thus compromising the server and potentially the entire network. This is why it is vital to look for these types of vulnerabilities through pentesting and secure code review.

This module will teach the basics of identifying and exploiting OS command injections. It also covers techniques to bypass various filters and mitigations used to prevent the exploitation of command injections. This module covers methods for exploiting command injections on both

Cross-Site Scripting (XSS)

Tier II - Easy - 6 hours

CREATOR 21y4d LAST UPDATED 7 Oct 2025

INTRODUCTION CONCLUSION

Web Application Penetration Testing is a vital part of any penetration test. It plays an essential role in identifying critical vulnerabilities that may lead to the organization's assets being compromised. Cross-Site Scripting (XSS) vulnerabilities are among the most common vulnerabilities in any web application, with studies indicating that over 80% of all web applications are vulnerable to it. An XSS vulnerability may allow an attacker to execute arbitrary JavaScript code within the target's browser, leading to various types of attacks, including compromising web admins and their web applications.
